

CS3220 Web and Internet Programming

Asynchronous JavaScript and XML (AJAX)

Chengyu Sun
California State University, Los Angeles

Improve Responsiveness of Web Applications

◆ Improve user experience

- Interactive
- **Responsive**

◆ Reduce server workload

Handle input events

Implement as much functionality on the client-side as possible

Hide the inevitable communication overhead from the user

Communicate with Server

- ◆ The *synchronous* request-response model is still a limiting factor in responsiveness
- ◆ Solution: XMLHttpRequest
 - A JavaScript object
 - ◆ Send request and receive response in JavaScript
 - Response can be handled *asynchronously*
 - ◆ Do not need to wait for the response

Understand Asynchronous ...

◆ Synchronous

```
send( request );  
  
// wait for response  
  
process( response );  
  
// do other things  
...
```

◆ Asynchronous

```
send( request );  
  
// don't wait for response  
  
process( response );  
  
// do other things  
...
```

*What's the problem??
What's the solution??*

... Understand Asynchronous

◆ Asynchronous

```
// callback function
function foo( response )
{
    process( response );
}
```

*Same as handling events
like click event in GUI
programming.*

```
// set a callback function
// which will be called
// when the response comes
// back
```

... ..

```
send( request );

// do other things
...
```

An XMLHttpRequest Example

◆ Servlet `Number`

◆ `number1.html`

- A client scripts sends an XMLHttpRequest
- A server program responds with a random number
- When the message arrives on the client, a *callback function* is invoked to update the document

About the Example

- ◆ `clickHandler()`
- ◆ `newXMLHttpRequest()`
- ◆ `updateDocument()`
- ◆ `getReadyStateHandler()`

XMLHttpRequest - Properties

◆ onreadystatechange

◆ readyState

- 0 – uninitialized
- 1 – loading
- 2 – loaded
- 3 – interactive
- 4 – complete

◆ status

◆ statusText

◆ responseBody

◆ responseStream

◆ responseText

◆ responseXML

XMLHttpRequest - Methods

- ◆ abort()
- ◆ getAllResponseHeaders()
- ◆ getResponseHeader(header)
- ◆ open(method, url, asyncFlag, username, password)
 - asyncFlag, username, password are optional
- ◆ send(messageBody)
- ◆ setRequestHeader(name, value)

So What is AJAX?

◆ Asynchronous JavaScript and XML

- JavaScript + XMLHttpRequest

◆ Characteristics of AJAX

- *Non-blocking* – the server response is handled asynchronously with a callback function
- *Partial page update* using JavaScript

More About AJAX

- ◆ XMLHttpRequest used to be an IE specific feature that received little attention
- ◆ Then Mozilla added it to Firefox
- ◆ Then it was used to create Google Maps
→ the beginning of “Web 2.0”

Key Elements of an AJAX Operation

Client

- ◆ Event
- ◆ Event handler
 - Create a XMLHttpRequest
 - Attach a callback function
 - Send the request
- ◆ Callback function
 - Process the response
 - Update the HTML Page

Server

- ◆ Process the request
- ◆ Send back a response

XMLHttpRequest is the name of the JavaScript object; the actual request is still an HTTP Request, i.e. there is no difference on the server side.

Problems of Plain JavaScript + XMLHttpRequest

- ◆ Each browser has their own JavaScript implementation
 - Code that works on some browsers may not work on others
- ◆ Implementing AJAX operations is quite tedious

jQuery To The Rescue

◆ Number2.html

- <http://api.jquery.com/category/ajax/>
- `$.ajax()`
 - ◆ URL can be specified as an argument or as a field of the `settings` object
 - ◆ `success` callback function will be called if the request is successful (i.e. response status code 200)

More About settings

Data Fields

- ◆ url
- ◆ method
- ◆ data

Callback Functions

- ◆ success
- ◆ error

Example: AJAX GuestBook

My Guest Book		
John says:	Hello!	Delete
Jane says:	Your website looks nice.	Delete
Joe says:	Nice to meet you. I'm from China.	Delete
<input type="text"/>	<input type="text"/>	Add

◆ Implement Add and Delete Entry using AJAX

About The Example

- ◆ User-defined attributes in HTML 5:
`data-*`
- ◆ DOM traversal with `closest()`
- ◆ Return an empty response
